TI In vitro action of a combination of selected **antimicrobial** agents and chondroitin sulfate

AB Chondroitin sulfate (CS), a highly anionic polymer and the most predominant sulfated glycosaminoglycan in connective tissues, was investigated regarding to its interaction with cationic **disinfectants**, which are used as anti-infectives in humans. **Combinations** of cetylpyridiniumchloride (CPC), chlorhexidine (CHex), and polyhexamethylene biguanide (**PHMB**) with CS, resp., were prepd. and the resulting microbicidal activity of the mixts. was tested in the quant. suspension test without org. matter. Polyvidone-iodine and Ringer's soln. were used as controls. Even pptd., the resulting test **combinations** behave differently against Staphylococcus aureus, Enterococcus faecium, Escherichia coli, Pseudomonas aeruginosa, and Candida albicans. CPC/CS demonstrated only microbicidal activity against Gram-pos. bacteria, and CHex/CS was more active against Gram-neg. bacteria and C. albicans. **PHMB**/CS, esp. in **combination** with CS-A, only revealed an **antimicrobial** effect against P. aeruginosa after 60 min action. The interaction of cationic **disinfectants** with CS showed depending on the

investigated microorganism a more or less controlled sustained release manner of the microbicidal agent from the pptd. complex, with the only exception of **PHMB** in **combination** with CS-C, which is completely neutralized. Polyvidone-iodine and Ringer's soln. were not affected by CS.

TI Field performance of a new **biocide** for biofouling control in water treatment applications
AB The performance of a water treatment **isothiazolone**-based **biocide** was evaluated through a field trial performed on 2 recirculating cooling towers at an eastern US steel mill. The **biocide** was tested alone on one tower and in **combination** with an oxidizing **biocide** (Cl) on the other tower. The **biocide** was slug-fed into each system 2 times/wk for time periods of 9 and 5 wk. Low use rates of the **isothiazolone** **biocide** were effective in preventing accumulation of a range of green algae and cyanobacteria on both cooling tower decks. Only when the **biocide** treatment was discontinued did an algal biomat form on both decks. In **combination** with Cl (fed daily), the **biocide** maintained the aerobic bacterial plate counts measured from the cooling tower water at low levels throughout the trial. Performance of this **biocide** was compared with that of terbuthylazine in lab. recirculating cooling tower studies.

TI **Biocides** as additives for metalworking formulations

AB Metalworking formulations (MWF) are complex mixts. of components, many of them being easily degraded by microorganisms. There are many problems assocd. with microbial growth in emulsions: corrosion, emulsion instability, health and environment risks, high maintenance costs. In order to solve these problems, **biocides** can be applied in two ways: as additives in the conc. MWF or as tank side addn. Both possibilities have pro and cons. We present some of our lab. and field trial results of testing these two ways. We tested in the lab. the new fluid A, a semi-synthetic emulsifiable oil for grinding, along with **biocides** in conc. and with **biocide** added periodically in the emulsion. The **biocides** were: **isothiazolone** (BI) and triazine (BT) type. The first test carried out was oximetry, when we estd. the difference between biodegradability of MWF A and the two formulations with **biocides** BI and BT. The oxygen uptake for A + BI and A + BT were much lower than for MWF alone. The next test we performed in the lab. was a challenge test, where every type of fluid was periodically inoculated with mixt. of inoculum and **biocide** for one month. The fluid A was degraded after first week; the **combination** A + BT had a medium resistance to microbial attack and it was necessary to add **biocide** BI in the emulsion. The **combination** A + BI had a very good behavior during the test. The next step was a field trial with fluid A + BT and **biocide** BI added every 2 or 3 wk. The expt. was performed in a workshop with central emulsion system. After 6 mo the A + BT fluid with **biocide** BI as tank side treatment, proved to have good resistance to microbial attack. We consider that **biocide** added in the conc. is more appropriate for MWF used in individual machines, where tank side addn. can be difficult. For large systems the most obvious problem is the top-up rate with MWF conc. that can not be controlled as strictly to ensure a const. concn. of **biocide** in emulsion. Every metalworking process has its specific conditions so that the decision between **biocide** in conc. or in a treatment program has to be taken on the spot.

TI Studies on **biocide** release and performance of novel antifungal paints

AB The controlled release of an **isothiazolone** fungicide, C9211 (4,5-dichloro-2-(n-octyl)-3(2H)-**isothiazolone**) from a urethane oil paint is described. The amt. of C9211 in the leachates was proportional to the loading in the paint. Paints contg. 8% C9211 in the undercoat but none in the topcoat released C9211 in the same amts. as paints contg. 4% C9211 in both undercoat and topcoat and the field performance of both paint **combinations** were identical. These results indicate that the C9211 is able to migrate through the urethane oil matrix replenishing any lost from the surface and thus giving effective antifungal control as long as **biocide** remains in the bulk of the paint.

TI Synergism within polyhexamethylene biguanide **biocide** formulations
AB Polyhexamethylene biguanides (**PHMB**) are mixts. of polymeric biguanides with an av. polymer length (n) of 5, but contg. high (n >15, mol. wt. 3300) and low mol. wt. material (n = 2, mol. wt. 400). Studies involving discrete mol. wt. fractions of **PHMB** have shown that **antimicrobial** activity of **PHMB** increases with increasing polymer length. Cell suspensions which had not been subjected to centrifugation and/or washing during their prepn. were employed. While activity was still obsd. to increase with n, the trend was much reduced as n exceeded six. Centrifugation and washing of cells markedly increased the activity of high but not low mol. wt. materials and corresponded to losses upon centrifugation of envelope lipopolysaccharide (LPS). Such envelope LPS represented high affinity binding sites on the surfaces of the cells. **Combinations** of various mol. wt. fractions of **PHMB** were evaluated against filter-washed cells and revealed a profound synergy between extremes of polymer length.

AB Compns. which provide synergistic microbial growth inhibition and biocidal activity, comprise (1) **isothiazolones** (I; R = lower alkyl; X = H, halo) and (2) hydroxymethylaminoacetic acid (II), its salts, or lower alkyl esters. **Antimicrobial** activity of Kathon CG [contg. I (R = Me, X = Cl) 1.15% and I (R = Me, X = H) 0.35%] in **combination** with II (trade name Suttocide A) was tested against gram-neg. bacteria. Obsd. MICs for the **combination** was less than the expected MICs based upon the results for each **antimicrobial** individually tested at half concns.
IT Bactericides, **Disinfectants**, and Antiseptics
(synergistic, hydroxymethylaminoacetate and isothiazolones in)

TI **Biocide** testing against corrosion-causing oil-field bacteria helps control plugging

AB Sessile bacteria cause plugging, corrosion, and souring in secondary and tertiary oil recovery operations; and the comparative efficacy of **biocides** against sessile populations of oil field water was detd. in carefully controlled test conditions. An app. was used that consists of a 1-in. pipe contg. a series of removable sterile metal studs exposed to water flowing through the system. The bacterial population on the studs was detd. under varying conditions of time and **biocide** dosage. Five different **biocides** were evaluated singly and in various **combinations**. **Isothiazolone** was the only **biocide** tested whose efficacy against sessile bacteria approached its efficacy against planktonic organisms.

ST **biocide** petroleum enhanced recovery; water petroleum reservoir bactericide; isothiazolone **biocide** oil field water

IT Bactericides, **Disinfectants**, and Antiseptics
(in petroleum enhanced recovery, for preventing corrosion and plugging, testing of)

IT Petroleum reservoirs
(water from, **biocides** for control of bacteria in, during oil recovery operations)

TI 2-Bromo-2-nitro-1,3-propanediol in **combination** with acetic acid or **isothiazolone** derivatives as fungicide and algicide

AB 2-Bromo-2-nitro-1,3-propanediol (I) [52-51-7] in **combination** with either YO2CCH2X (X = halogen, Y = BrCH2CO2CH2CH:CHCH2, PhCH2, BrCH2CO2CH2CH2, or HOCH2CH2CH2) or II (Y = H, alkyl, etc.; R and R1 = H, halogen, or alkyl; M = alkali metal; heavy metal, etc.; Z = anion ; a = 1 or 2) are synergistic **antimicrobial** and antialgae agents. For example, the min. inhibitory concn. of I alone in the culture medium of Staphylococcus aureus was 12 ppm, but that of I in **combination** with 1,4-bis(bromoacetoxy)-2-butene [20679-58-7] was only 1 ppm. The min. inhibitory concn. of a mixt. of I with **isothiazolone** derivs. against Casmarium or Oscillatoria was <1 ppm.

IT Algicides
Fungicides and Fungistats
(bromonitropropanediol in **combination** with **isothiazolone** derivs.)
